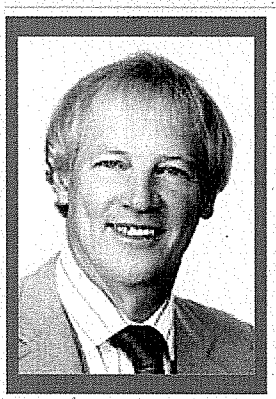
Alexander J. Horne

Professor Emeritus anywaters@aol.com



Biography

Professor Horne's research emphasizes quantification of environmental and ecological problems to define engineered solutions. Some of the problems tackled have been the in situ measurement of toxic and biostimulatory effects of highly-treated wastewaters in estuaries, rivers, wetlands, lakes, reservoirs, and oceans. Effects of heavy metals, oil spills, chlorinated wastewaters, and selenium have been studied recently. Emphasis has been on indigenous organism communities rather than individual organisms from laboratory cultures. The effects of water volume, timing of water withdrawals, and water quality on reservoir problems including taste and odor and eutrophication are of current interest. Special attention has been given to teaching students high precision but "low tech" methodology which allows many more samples to be analyzed. In turn this permits statistically significant detection of small environmental effects. Current work on water quality in reservoirs and the design of new reservoirs emphasizes problems in semi-arid regions such as Southern and Central California.

Education

Ph.D.	Nitrogen Fixation, University of Dundee, Scotland	1969
Honours,	Biological Chemistry, Bristol University,	1964

B.Sc. United Kingdom

Dr. Alex Horne was the professor of Ecological Engineering at the Department of Civil & Environmental Engineering at the University of California, Berkeley from 1971-2003. Early studies included the English Lake District lakes, wetlands and oceans in Antarctica, and East African lakes. USA work began on eutrophication at Clear Lake and many reservoirs in California in 1970. His Berkeley career was been devoted to determining the effects and control of metal, sewage and organic pollutants on lakes, rivers, estuaries and the open ocean. He is proud of his part in the design of over 1,000 acres of beautiful wetlands that combine water treatment, wildlife habitat enhancement, and aesthetics. Some wetlands have received engineering awards and are a part of the drinking water supply for over 2 million people from Southern California to Arizona. His work first demonstrated a major reversal of eutrophication in a large reservoir by the addition of pure oxygen to the hypolimnion. Work on mercury was primarily with Dr. Doris Vidal and reduction of methyl-mercury by lake oxygenation. He over 225 publications and wrote the popular undergraduate textbook, *Limnology*. (McGraw-Hill, 1994, 2nd Ed, 564 p.).

Selected Recent publications emphasizing mercury
